Problem statement: When I want to play checkers with friends but I don't have a physical board or pieces, the only way to play are apps that require downloads or accounts. I enjoy board games and want to play them easily and conveniently without setup.

	Urgent	Not Urgent
Important	Do - (Your MVP) ● Board display with coordinates ● Move input parsing ● Diagonal movement and alternating turns ● Captures, forced capture rule, and multi-jumps ● Kings (promotion and backwards movement) ● Rejection of illegal moves ● Win detection	Schedule - (For V2.0+) ● Undo move feature ● Checkers bot ● Draw offers ● Legal Move highlighting
Not Important	Delegate - (Use a library) ● Reading input with IO.readln ● Move lists with ArrayList ● Parsing input with String methods ● Distance check with Math.abs	Delete - (Cut it) ● GUI ● Online Multiplayer ● Game Timer ● Accounts or leaderboards

<u>Questions for Tech Stack</u>
- Language: Java
- Libraries: Just the Java standard library. java.util.ArrayList for move lists, and built-in String and Math methods for parsing moves and checking diagonal distance
- No data storage required for MVP (it lives in memory), and no external data required
- External tools are git/github, and an IDE like VS Code/terminal

<u>Chunked Build Plan</u>
1. Set up the Git repo and project with the README and design doc
2. Create Piece and Board, and print the starting position, the 8x8 grid with 12 pieces each side
3. Parse user input and validate squares
4. Code basic moves and alternating turns
5. Single-jump captures
6. King promotion and movement

7. Ensure legal moves are made and captures are forced
8. Multi-jump chains and win detection
9. Testing, cleanup, and final README
